

VACANCY

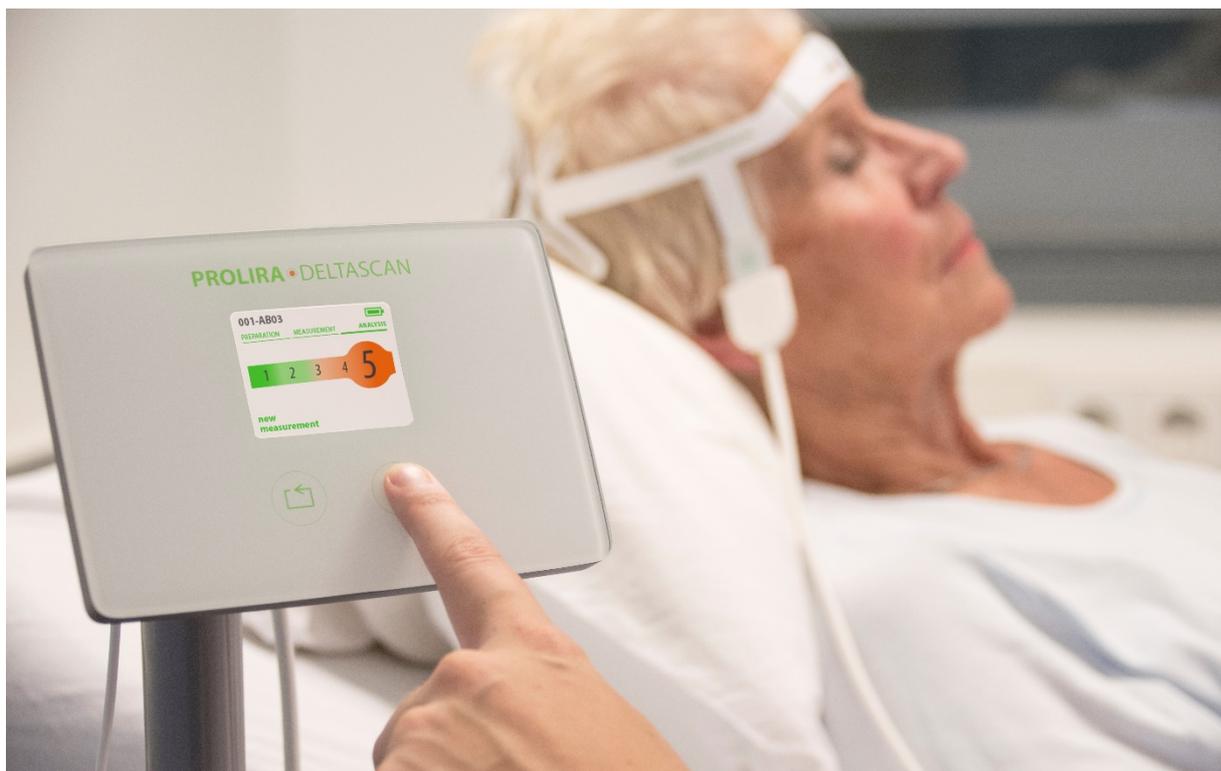

CLINICAL DATA SPECIALIST

October 2021

DELTASCAN[®] BRAIN STATE MONITOR

Bedside EEG for medical decision support acute encephalopathy ● delirium

Prolira has developed the first device in the world for EEG-based brain state monitoring

Prolira is on a mission to improve healthcare for hospitalized frail elderly and ICU patients. DeltaScan is the first CE approved medical device that can help detect and monitor acute encephalopathy and delirium. Acute encephalopathy and delirium are different words for acute brain failure, a complication with serious consequences for patients and their environment, and with negative financial consequences for care and society. DeltaScan makes it possible for healthcare professionals to objectively measure the brain state, by means of a single-channel EEG. The resulting score (between 1 and 5) states how likely or how unlikely the EEG fits with a patient with acute encephalopathy/delirium. The DeltaScan device is used as an alternative to the currently used subjective questionnaires such as the CAM-ICU.

The company

Prolira BV is currently introducing DeltaScan, the first medical device for detection and monitoring of acute encephalopathy and delirium into practice in hospital departments. We have the ambition to grow, and soon we want to implement DeltaScan in many wards and ICUs in the Netherlands and Germany. Will you come and help us on this challenge?

Prolira BV is a spin-off company of the University Medical Center Utrecht in the Netherlands and was founded in 2015. And together with the UMC Utrecht we have done extensive research for the development and validation of DeltaScan with strong results. Prolira is located at the Utrecht Science Park. We are a fast-growing team of currently 13 professionals, and in addition, for the German market Orion Pharma is our exclusive and experienced sales channel.

Clinical Data Specialist

Prolira is looking for a Clinical Data Specialist with a strong affinity for medical data, medical technology and implementing healthcare innovations. The Clinical Data Specialist preferably has work experience in or with at least one of the following departments within a hospital; in the ICU, a cardio thoracic nursing department or a geriatric (traumatology) department.

The Clinical Data Specialist is strongly motivated to improve patient care through working and communicating with doctors and nurses in executing clinical projects in which DeltaScan is used. The Clinical Data Specialist has knowledge about research grant applications and is able to guide research through medical ethical committee submissions.

DeltaScan is now being used clinically, both in regular care and in scientific research projects. The added value of DeltaScan is expressed in several patient outcome parameters. Also, EEG data is acquired from the large-scale use of bedside EEG measurements in the clinics. For quality and research purposes this data needs to be analyzed. The Clinical Data Specialist is able to work with EEG data or is willing to learn how to do so. The main task of the Clinical Data Specialist is to manage the data that is acquired from the hospitals that use DeltaScan, and work with hospitals to optimise the value of data.

We are looking for a team player who functions as the bridge between clinics and Prolira considering clinical projects and data gathering. Through this work, you will contribute to the development and optimal implementation of DeltaScan in the Netherlands, Germany and

the USA. You will report to the Chief Clinical Specialist in the Netherlands and will be part of the clinical team.

WE ARE LOOKING FOR

We are looking for a (healthcare) professional that is an expert in:

- Clinical data in relation to new medical technology
- Knowledge of and experience in working with clinical data that are relevant to database management and analysis

YOU'RE GOOD AT

- Database management and analysis
- Working together; building good customer relationships, working and planning independently
- Interpreting scientific studies and using their knowledge in the field
- You are strong in building a relationships with healthcare professionals
- Project management
- Languages: Dutch and English. German would be very nice to have

WHAT WE HAVE TO OFFER

- Contributing to clinical pilots with a unique and innovative medical device to revolutionize delirium care
- Working with international clinical experts
- Stimulating start-up environment
- Working together with a multidisciplinary team of R&D, marketing and sales professionals
- Competitive salary

APPLY: IF THIS IS YOUR JOB?!
